Work term 1

Computer Engineering Software Co-op

Coordinator: Alyson Rumsby

1 Overview

ATB Financial, or Alberta Treasury Branches is a financial institution in Alberta, Canada. Established in 1938, ATB Financial is a crown corporation with 50.7 billion dollars in assets.[1] ATB has over five thousand team members who support the one hundred and seventy-five branches, one hundred and forty-two agencies, three Entrepreneur Centeres, a Customer Care Centre, and mobile and onine banking. These services serve over seven hundred and forty thousand customers. [1, 2]

I joined ATB Financial through its ATB 101 program, with about one hundred other students, fifty in Edmonton, and fifty in Calgary. ATB 101 is a program offered by ATB Financial for summer students of various disciplines. In addition to the work done by each individual in our regular positions, there are events which introduce us to the company's culture. Furthermore, we are put into teams of about ten individuals to solve actual business problems. This functions very similarly to a case competition, except that it runs for four months.

I am a developer working on the future ATB Online for Business Website. My team falls under the transformation umbrella, which makes up a large part of the ATB organization. Its purpose is to “reimagine banking” [3]. Specifically, I’m a part of the digital transformation team. When one thinks of a bank, programming is not usually in the list of things that comes to mind. However, technology plays a huge role in today’s world of banking, and online banking is one of the many aspects of banking in the digital world today.

2 Learning Opportunities

In the short time I have had working so far for ATB Financial, the organization has presented countless exciting challenges and learning opportunities. From day one, I was put outside of my comfort zone, presented with the challenge of getting accustomed to a new operating system. Having seldomly used macOS before, there was a bit of a learning curve. Even though macOS is designed to be “user friendly”, there are some nuances to get used to coming from a Linux or Windows environment. As soon as compliance training was over, I was given the opportunity to take online courses for almost two weeks to familiarize myself with the technologies that I am working with now. I took refresher courses on JavaScript, and then I moved on to learning about creating web applications using React and Redux. React is a JavaScript framework developed by Facebook, which enables the creation of web UI with reusable components[4], and Redux is a state container for JavaScript apps[5] which works nicely with React. While coding at ATB, I have learned to program and organize my code in ways that are simply not taught in traditional classes.

In addition to coding, I was introduced to the practice of agile workflow. The idea of agile is to work together in teams, fail fast, and to regularly reflect on things as a team.[6] In my team, we had daily scrum meetings, where we would update everyone with what’s going on, and if there are any blockers. Using an agile workflow allows us to react and adapt quickly whenever there are changes. In the spirit of agile learning, the ATB 101 program allows us students to further improve our skills by working on a four-month “capstone project” As mentioned before, the ATB 101 program presents real business challenges that we learn to solve in groups. My team’s task was to reimagine rural branches. The goal was to figure out how we can drive a better customer experience by incorporating arts and culture in rural branches, as other banks abandon these communities [7]. In our team of ten people, we had meetings two times a week, as we worked together on coming up with a solution. This

experience was quite unique, since most other team members were business students and I was the only computer programmer. In addition, to put our agile skills to the test, there were sometimes some unexpected challenges, such as suddenly being told that we have to produce a video in the last few weeks of the project. At the end, each team presents the challenge they worked on and the solution they came up with. As one may notice, this process was wildly different from my regular role as a programmer, which provided a unique opportunity for me to improve on my skills outside of coding. Going into this job as a programmer, I did not expect to be part of such an amazing team, in addition to the team that I work with every day.

3 Work Preferences

Being my first job, I did not know what to expect. However, I was initially quite surprised with ATB Financial's structure<https://www.lornerubis.com/2018/06/and-then-there-were-11/>. Everyone, including managers and executives are very approachable and friendly. The Chief Executive Officer himself, works at a desk just like everyone else who works in the office. The idea behind this is to leave the corner spots with windows for the meeting rooms that everyone has access to. Overall, I really like how ATB is structured. From what I gather, some aspects of the philosophy behind ATB Financial's structure are outrageously different compared to some other corporate institutions. This was exemplified during Culture Day. As a part of the ATB 101 program, each student must attend Culture Day, which happens once a year. Culture Day really highlighted the company's core values, manifested as the eleven "ATB's"[8]. On this day, company executives and other respected individuals shared multiple stories related to the 11 core values which we refer to as the "ATB's". These stories put the company's values into perspective, which makes ATB's structure make sense. Taken

together, the eleven ATB's, Culture Day, and the ATB 101 program highlight the fact that everyone at ATB is there to support each other.

The management style was very hands-off, at least in my role. As a student, I thought that I was given a lot of responsibility, however, I am glad with the level of trust I was given, as I found myself feeling comfortable and motivated to work. Initially, I was confused as to why no work hours were specified. As it turns out, work hours are extremely flexible, and it is up to you to make sure that you are putting in the hours, and to take breaks when you need them. You are given a laptop, so that you are not tied to your desk. This freedom of flexibility allows you to be as comfortable as possible, whether you prefer to work at home, in a coffee shop, or in the office. Even though I was given the opportunity to work from home, I found myself still showing up in person at the office because I was able to have a human connection when attending meetings, and asking for help. Even though I have not worked anywhere else beforehand, I found myself being comfortable working in the environment ATB Financial has offered. This does not surprise me, as it seems that nearly every step is taken to make ATB Financial's employees feel comfortable in the space they work in.

As a computer programmer, I have always expected to just be in the office, behind a computer, converting coffee into code. However, I have realized that a job in my field involves a lot more than that. I never thought that I would be able to work on a user interface, but my job at ATB has proved me wrong. Perhaps in the future, I will learn backend stuff, devops, artificial intelligence, machine learning, or something else. One thing that is for sure, though, is that no matter what I do in the future the only constant I expect is to be continually learning something new every day at work, as I have while working at ATB Financial so far.
